10:00 - 11:15 AM

Practical Guide to the Management of Atherogenic Lipids

SPEAKERS

Michael Miller, MD
James A. Underberg, MS, MD, FACP, FNLA

pri med[®]

Disclosures

This session is supported by an independent educational grant from **Amarin Pharma Inc.**

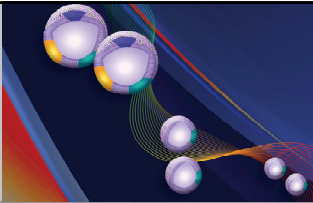

The following relationships exist related to this presentation:

- ▶ Michael Miller, MD: Advisory Board for Akcea Therapeutics, Inc. Consultant for Amarin Pharma Inc.
- ▶ James A. Underberg, MS, MD, FACP, FNLA: Advisory Board for Akcea Therapeutics, Inc.; Alexion Pharmaceuticals, Inc.; Amgen Inc.; Invitae Corporation; Regeneron Pharmaceuticals, Inc.; and Sanofi US. Consultant for Amarin Pharma Inc. and Amgen Inc. Contracted Research for Aegerion Pharmaceuticals and Pfizer Inc. Speaker's Bureau for Alexion Pharmaceuticals, Inc.; Amarin Pharma Inc.; Amgen Inc.; Regeneron Pharmaceuticals, Inc.; Sanofi US; and True Health Diagnostics.

Off-Label/Investigational Discussion

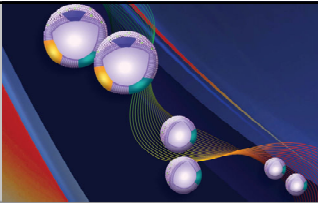

- ▶ In accordance with pmiCME policy, faculty have been asked to disclose discussion of unlabeled or unapproved use(s) of drugs or devices during the course of their presentations.

Practical Guide to the Management of Atherogenic Lipids

Atherogenic Lipids and Cardiovascular Disease

Michael Miller, MD
Professor of Cardiovascular Medicine, Epidemiology & Public Health
University of Maryland School of Medicine
Director, Center for Preventive Cardiology
University of Maryland Medical Center
Baltimore, MD

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

Introduction to Triglyceride-rich Lipoproteins

56-yr Hispanic Woman with T2DM and No CVD

Meds: Atorvastatin 40 mg/d, metformin 1000 mg BID, HCTZ 50 mg/d

Exam: BMI=34 kg/m², BP=128/82 mm Hg, Waist=36", Non-smoker

Labs:

| | |
|-----------------|-----------|
| Fasting glucose | 115 mg/dL |
| A1c | 6.2% |
| TC | 208 mg/dL |
| TG | 559 mg/dL |
| HDL-C | 36 mg/dL |
| LDL-C | 88 mg/dL |
| Non-HDL-C | 172 mg/dL |

A1c=glycosylated hemoglobin; BMI=body mass index; BP=blood pressure; CHD=coronary heart disease; HTG=hypertriglyceridemia; T2DM=type 2 diabetes mellitus; TC=total cholesterol.

Human Serum Lipoproteins

Structural components of lipoproteins

Relation of diameter to density

Hypertriglyceridemia (TG ≥ 150 mg/dL) Is More Common in Men than Women and in Mexican-Americans than Whites or Blacks

Carroll MD et al. NCHS Data Brief, No 198. National Center for Health Statistics, 2015.

Obesity and Hypertriglyceridemia (Fasting TG ≥ 150 mg/dL)

Carroll MD et al. NCHS Data Brief, No 198. National Center for Health Statistics, 2015.

Strong Association of \uparrow Risk of MI and \uparrow All-cause Mortality Shown with \uparrow Non-fasting Plasma TG Levels

82,890 individuals from the Copenhagen City Heart Study and Copenhagen General Population Study

Hazard ratios (HR, blue line) with 95% confidence intervals (orange dotted lines).
Nonfasting plasma TGs ('remnant cholesterol') was calculated as nonfasting total cholesterol minus HDL-C minus LDL-C that was calculated as TG/5.
 Nordestgaard BG. *Circ Res*. 2016;118:547-63.

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

Genetic Studies Examined TG-rich Lipoprotein Causality for Atherosclerotic Cardiovascular Disease (ASCVD)

- Causality directly connects one process (the cause, eg, remnant) with another (the effect, eg, ASCVD)
 - Several different types of evidence are necessary to determine whether elevated TG-rich lipoproteins are a cause of ASCVD
- Besides epidemiology, this includes evidence from
 - Randomized trials
 - Mendelian randomization studies of human genetics
 - Double-blind and randomized because of nature's own method of distributing alleles
 - Capture a life-long effect
 - Genotypes do not change on repeated measurement
 - Biological insight on potential mechanisms from elevated TG-rich lipoproteins to atherosclerosis and ASCVD

Nordestgaard BG. *Circ Res*. 2016;118:547-63.

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

TG ≥ 500 mg/dL Is Associated with Greatly Increased Pancreatitis Risk

Risk of incident pancreatitis \uparrow by 4% for every 100-mg/dL \uparrow in TG concentration*

*After adjustment for covariates and removal of patients hospitalized for gallstones, chronic pancreatitis, alcohol-related morbidities, renal failure, and other biliary disease. Murphy MJ et al. *JAMA Intern Med.* 2013;173:162-4.

Important Secondary Causes of HTG

| Cause | Clinically useful details |
|--------------------------------|--|
| Caloric imbalance | \downarrow Exercise, \uparrow Saturated fat, \uparrow Glycemic index, Excess alcohol intake |
| \uparrow Carbohydrate intake | \uparrow Simple sugars (fructose \gg glucose, etc.) and \downarrow Dietary fiber |
| Adiposity | Especially \uparrow visceral adiposity |
| Diabetes mellitus | Especially if poorly controlled |
| Hypothyroidism | If not adequately controlled |
| Nephrotic syndrome | |
| Medications | Antiretroviral regimens (for HIV); Oral estrogen; Glucocorticoids; Isotretinoin; Some phenothiazines and 2nd-generation antipsychotics; Nonselective beta-blockers; Thiazide diuretics; Tamoxifen; Bile-acid seq. |
| Recreational drugs | Alcohol, heavy marijuana use (\uparrow Apo C-III) |

Apo=apolipoprotein; HIV=human immunodeficiency virus. Bays HE. In: Kwiterovich PO Jr, ed. *The Johns Hopkins Textbook of Dyslipidemia*. 1st ed. Lippincott Williams & Wilkins; 2010:245-57.

High TG Levels Are Often Associated with Other Cardio-Metabolic Risk Factors

- Obesity
- Physical inactivity
- Diabetes mellitus
- High blood pressure
- Elevated cholesterol levels
- Low HDL-C levels

The "Atherogenic Triad" in diabetes:

- \uparrow Triglyceride-rich lipoproteins (TRLs)
- \uparrow Small dense LDL-C
- \downarrow HDL-C

American Heart Association (AHA) Scientific Statement. Miller M et al. *Circulation.* 2011;123:2292-333.

Eruptive cutaneous xanthomas
Familial chylomicronemia (hyperlipoproteinemia type 1) or primary mixed dyslipidemia (hyperlipoproteinemia type 5)

Lipemic plasma

Lipemia retinalis
Milky appearance of the retinal vessels and pink retina can be seen when TG concentration >3000 mg/dL

Tuberous xanthomas on elbows
Usually appear on extensor surfaces in familial dysbetalipoproteinemia (hyperlipoproteinemia type 3)

Palmar crease xanthomas
familial dysbetalipoproteinemia (hyperlipoproteinemia type 3)

Yuan G et al. *CMAJ.* 2007;176:1113-20.

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

Non-HDL-C vs LDL-C

- The Framingham Heart Study, Women's Health Study, Health Professionals Follow-up Study, and others showed the superiority of non-HDL-C vs LDL-C as an independent CV risk factor
- Unless measured directly, LDL-C is usually calculated from total cholesterol, HDL-C, and TG (Friedewald equation)
- Friedewald-calculated LDL-C tends to be artifactually depressed in/if:
 - Non-fasting blood sample
 - TG > ~200 (fasting or not)
 - TG < ~50
 - LDL-C < 50
- Non-HDL-C remains accurate in all of the above situations

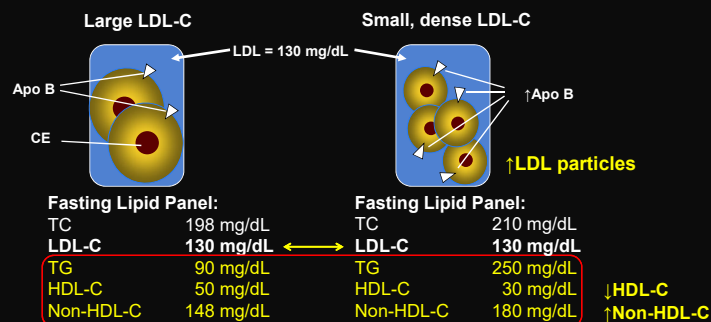

With Increasing HTG, VLDL-C Increases as LDL-C Decreases, Making non-HDL-C a Better CVD Lipid Marker Than LDL-C

Lipoprotein cholesterol distribution among 72,000 Danish individuals off lipid-lowering therapy

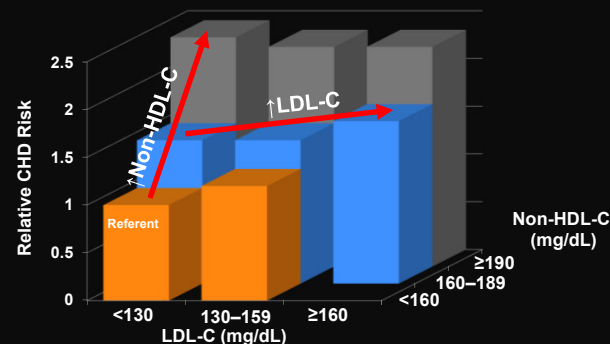

Varbo A et al. J Am Coll Cardiol. 2013;61:427-36.

In HTG Subjects, LDL-C Measurements Underestimate CVD Risk

Otvos JD et al. Am J Cardiol. 2002;90:221-291.

Framingham Heart Study: Non-HDL-C Is a Stronger Predictor of ASCVD Risk than LDL-C

Liu J et al. Am J Cardiol. 2006;98:1363-8. (Framingham Study)

Non-HDL-C >130 mg/dL Is a Better ASCVD Risk Predictor Compared With LDL-C >100 mg/dL

Meta-analysis data at baseline and at 1-year follow-up from 62,154 patients enrolled in 8 randomized controlled statin trials published 1994–2008

Boekholdt SM et al. JAMA. 2012;307:1302-9.

Summary

- Elevated TG levels are common, especially among the overweight, obese, and diabetics
- Remnants of TG-rich lipoproteins (chylomicron remnants, VLDL remnants, IDL) promote atherogenesis
- Non-HDL-C is a better CVD predictor than LDL-C, especially in patients with HTG
- Very high TGs are associated with increased risk for pancreatitis

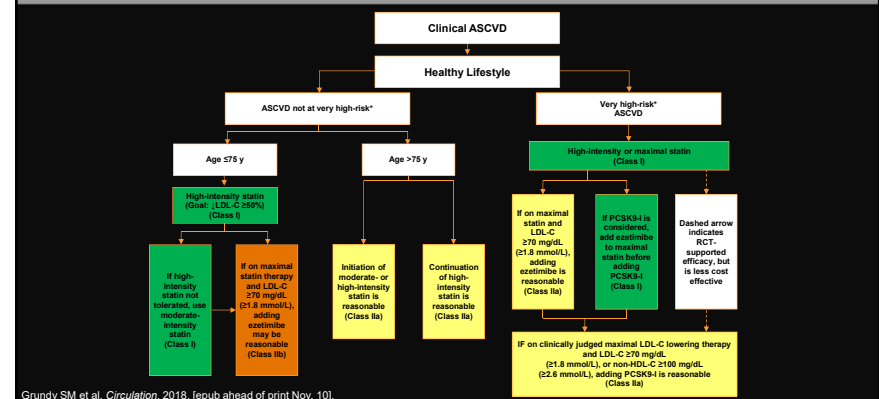

Practical Approach to the Management of Atherogenic Lipids

James A. Underberg, MD, MS

Clinical Lipidology
Clinical Assistant Professor of Medicine
NYU School of Medicine & NYU Center for Prevention of Cardiovascular Disease
Director, Bellevue Hospital Lipid Clinic
President, National Lipid Association
New York, NY

Secondary Prevention

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

Very High Risk of Future CVD Events

Major ASCVD Events

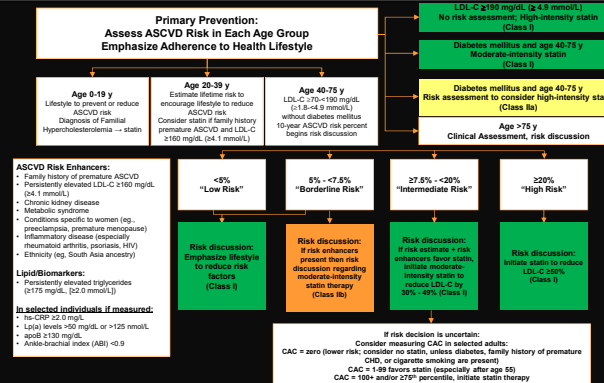

- Recent ACS (within the past 12 mo)
- History of MI (other than recent ACS event listed above)
- History of ischemic stroke
- Symptomatic peripheral arterial disease (history of claudication with ABD <0.85, or previous revascularization or amputation)

High-Risk Conditions

- Age ≥ 65 y
- Heterozygous familial hypercholesterolemia
- History of prior coronary artery bypass surgery or percutaneous coronary intervention outside of the major ASCVD event(s)
- Diabetes mellitus
- Hypertension
- CKD (eGFR 15-59 mL/min/1.73 m²)
- Current smoking
- Persistently elevated LDL-C (LDL-C ≥ 100 mg/dL [≥ 2.6 mmol/L]) despite maximally tolerated statin therapy and ezetimibe
- History of congestive HF

Grundt SM et al. *Circulation*. 2018. [pub ahead of print Nov. 10].

Primary Prevention

Grundt SM et al. *Circulation*. 2018. [pub ahead of print Nov. 10].

Diagnosing and Treating Secondary Causes of HTG

- Take a Hx of diet (calories, fat, sugar, alcohol, body weight and weight changes) and physical activity (frequency, type, intensity)
- Measure BMI & waist, TSH, fasting glucose, A1c, urinary protein
- Recommend low-calorie, low-sugar, low-to-no alcohol, low-fat but high-fiber diet
- Recommend patient-appropriate physical activity plan
- Treat underlying diseases causing HTG (eg, \uparrow A1c, \downarrow thyroid function)
- Consider possible changes away from TG-raising medications

Bays HE. In: Kwitterovich PO Jr, ed. *The Johns Hopkins Textbook of Dyslipidemia*. 1st ed. Lippincott Williams & Wilkins;2010:245-57.

NLA: Targets of Therapy – Triglycerides

Elevated TG level: Not a target of therapy, except when very high (≥ 500 mg/dL)

- TG 200–499 mg/dL: Targets of therapy:
 - Non-HDL-C
 - LDL-C
- TG ≥ 500 mg/dL (especially ≥ 1000 mg/dL): Primary goal of therapy (to prevent pancreatitis):
 - \downarrow TG concentration to <500 mg/dL

NLA=National Lipid Association. Jacobson TA et al. *J Clin Lipidol*. 2014;8:473-88.

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

Lifestyle Approaches to the Management of HTG

Lifestyle and Diet Can Have Big Effects on Hypertriglyceridemia

Diet / Lifestyle Change

Weight loss in overweight or obese individuals (at least 5–10%)

Diet

↑ Fruits, veggies & low/non-fat dairy
↓ Total carb, added sugars
↓ Total fat (if fasting TG >~800)
↑ Dietary fiber

Exercise

Any type is helpful, the more the better
(e.g. brisk 30-min walk, 3x/wk)

20% - 50% reduction in TG may be possible with lifestyle interventions!

After Miller M et al. J Am Coll Cardiol. 2008;51:724-30; Sampson UK et al. Curr Atheroscler Rep. 2012;14:1-10.

Lipid Effects of ↑Physical Activity and ↓Weight in Patients with Overweight/Obesity

- **↓TG: 1st & most notable effect of ↑physical activity on lipid profile**
Exercise may ↓TG even without weight loss
 - Sustained 3%–5% weight ↓ may cause clinically meaningful ↓TG
 - Degree of TG-lowering is proportional to baseline TG
- **↑HDL-C: Requires stable weight loss ± extensive physical activity**
 - ~700–2000 kcal/week (~30 min/day, moderate intensity)
- **LDL-C often does not change**
 - But ↓weight ± ↑exercise should ↑ particle size and/or may ↓LDL-C levels

Adapted from Bays HE et al. J Clin Lipidol. 2013;7:304-83; Couillard C et al. Arterioscler Thromb Vasc Biol. 2001;21:1226-32.

Diets Rich in Marine Sources of EPA and DHA Are Associated with Decreased Stroke Risk

| | EPA+DHA (mg/100 g) |
|------------------------|--------------------|
| Anchovy | 2055 |
| Herring, Atlantic | 2014 |
| Salmon, farmed | 1966 |
| Salmon, wild | 1840 |
| Mackerel, Atlantic | 1203 |
| Bluefish | 988 |
| Sardines, Atlantic | 982 |
| Trout | 936 |
| Goldenbass (tilefish) | 905 |
| Swordfish | 899 |
| Tuna, white (albacore) | 862 |
| Mussels | 782 |
| Striped bass | 754 |
| Shark | 689 |
| Pollock, Atlantic | 542 |

Nurses' Health Study

- 1,086,261 person-years of follow-up
- 574 incident strokes documented

Marine-based Meals Stroke Reduced Risk

| | |
|---------------|-----|
| 1–3 per month | 7% |
| 1 per week | 22% |
| 2–4 per week | 27% |
| >5 per week | 52% |

FOURIER: Significant Reduction in CV Events, but Significant Risk Remains

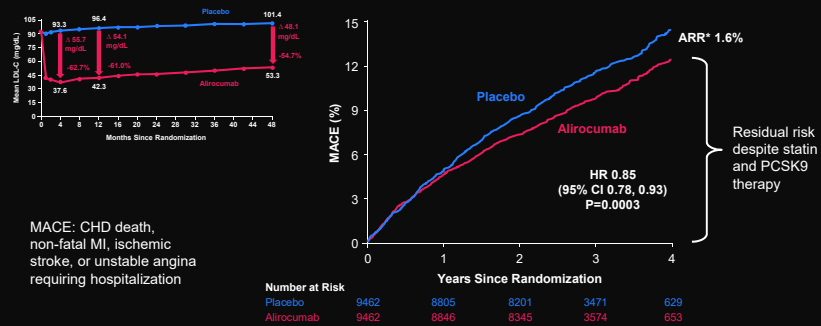

Residual risk despite statin and PCSK9 therapy

Sabatine MS et al. *N Engl J Med*. 2017;376:1713-22.

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

ODYSSEY OUTCOMES Also Shows Significant Reduction in CV Events, But Significant Risk Remains

HTG Is Associated With Residual Risk Despite LDL-C <70 mg/dL on Statin

HTG Is Associated With Residual Risk Despite LDL-C <70 mg/dL on Statin

HTG Is Associated With Residual Risk Despite LDL-C <70 mg/dL on Statin

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

Proportion of CAD Patients Taking Statin Therapy Who Have Residual *Cholesterol* or *Inflammatory* Risk

CANTOS: Reducing Inflammation “Alone” (Anti IL1-beta mAb, marker hsCRP) Reduces CV Events

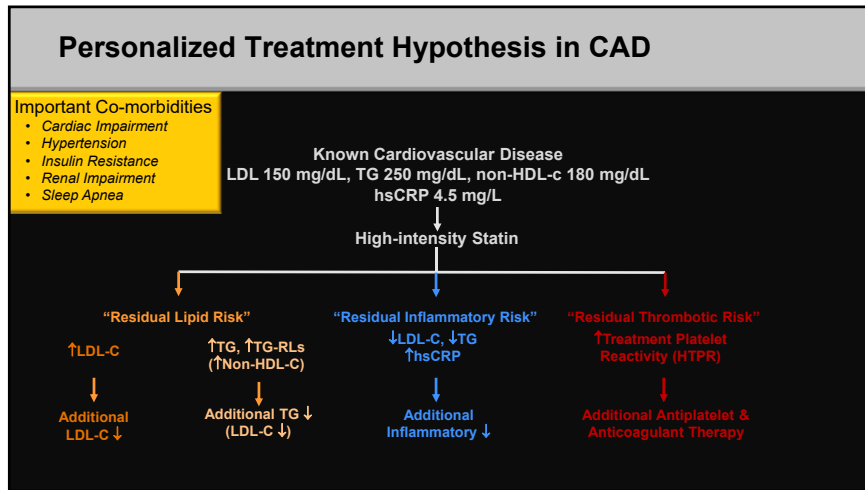

SGLT2i and GLP1-RA Lower CV risk in DM2

COMPASS: NOAC Rivaroxaban Heralds a Change in CAD or PAD Management

Syllabi/Slides for this program are a supplement to the live CME session and are not intended for other purposes.

Working Towards a Pragmatic, Personalized Approach to Reduce Residual CVD Risk

| Causes | Setting (Threshold) | Rx Value | Rx Choices |
|--------------------------|---------------------|--|---|
| LDL-C | ≥70 mg/dL | Balance of • Efficacy • Safety • QoL • Cost | Statin, Ezetimibe, PCSK9i |
| HbA1c | ≥6.5 mg/dL | | SGLT-2i, GLP-1 agonist |
| HsCRP | >2 mg/L | | Canakinumab or methotrexate? |
| Residual thrombotic risk | ACS | | Single, dual antiplatelet, rivaroxaban? |
| TG | >150 mg/dL | | Statin + Omega 3 (vs fibrate??) |

Pharmacologic Management of HTG

Therapy for Very High TG: Current FDA-approved

| Drug Class | TG >500 mg/dL* | Notable Adverse Effects (AEs)† |
|--------------------------------------|----------------|---|
| Statins ^a | ✓ | Myalgia, new-onset DM, hyperglycemia |
| Omega-3 FA (EPA/DHA) ^b | ✓ | Eructation, dyspepsia, taste perversion |
| Omega-3 FA (EPA only) ^b | ✓ | Arthralgia |
| Fenofibrate ^c | ✓ | Abnormal liver function test, myalgia, increased creatinine, nausea |
| Extended-release niacin ^d | ✓ | Flushing, nausea, diarrhea, vomiting, cough |

*Data from individual product labeling for each drug in patients with very high TG. †AEs: Incidence >Placebo and: ≥3% for omega-3/EPA/DHA; ≥2% for omega-3/EPA, Fenofibrate, Statins; ≥5% for Niacin. ^aAtorvastatin, rosuvastatin, simvastatin. ^b4 g per day, ^c145 mg per day, ^d2 g per day. Lipid Effects of Drug Classes in Mixed Dyslipidemia and HTG

| Medication | TG | LDL-C | HDL-C | Non-HDL-C |
|---------------------------|------------|------------|------------|------------|
| | Range, % | | | |
| Mixed dyslipidemia | | | | |
| • Statins | -10 to -37 | -26 to -63 | +5 to +16 | -44 to -60 |
| • Omega-3 fatty acids | -19 to -44 | -6 to +25 | -5 to +7 | -1 to -7 |
| • Fibrates | -24 to -36 | -5 to -31 | +10 to +16 | -17 |
| • Niacin | -5 to -38 | -3 to -17 | +10 to +26 | NR |
| Isolated HTG | | | | |
| • Statins | -21 to -52 | -27 to -45 | +3 to +22 | -29 to -52 |
| • Omega-3 fatty acids | -26 to -52 | -6 to +49 | +9 to +14 | -10 to -14 |
| • Fibrates | -46 to -62 | +3 to +47 | +18 to +23 | NR |

NR=not reported. Maki KC, Bays HE, Dicklin MR. *J Clin Lipidol*. 2012;6:413-26.

Fibrate Outcome Studies with Statin Use

| Study | CV Risk Profile | N | Daily Intervention | Statin Use | Baseline TG Level | Effect on TG Level | Follow-up (mean) |
|--------|--|------|----------------------------------|---|--------------------|--------------------|------------------|
| ACCORD | • T2DM • 40-79 yrs + CVD or • 55-79 yrs + ≥2 CV risk factors | 5518 | Fenofibrate | Open-label simvastatin (mean dose: 22 mg) | 162 mg/dL (median) | ~26% | 4.7 yrs |
| FIELD | 50-75 yrs + T2DM | 9795 | Micronized fenofibrate 200 mg QD | Added during study in 2547 pts | 154 mg/dL (median) | ~30% at 1 year | 5 yrs |

Total Trial Population

Subjects **unselected** for Dyslipidemia

| Study (treatment) | OR (95% CI) |
|------------------------------------|------------------|
| ACCORD (simvastatin + fenofibrate) | 0.71 (0.58-0.87) |
| FIELD (fenofibrate) | 0.71 (0.58-0.87) |

Nonfatal MI or Stroke or CV death
Nonfatal MI or CHD death

Post hoc: TG≥204 mg/dL; HDL-C ≤34 mg/dL

Subjects **with** Dyslipidemia

| Study (treatment) | OR (95% CI) |
|------------------------------------|------------------|
| ACCORD (simvastatin + fenofibrate) | 0.51 (0.38-0.68) |
| FIELD (fenofibrate) | 0.51 (0.38-0.68) |

Proposed Mechanisms of Potential CV Benefits of Omega-3 FA

Anti-arrhythmic

- ↓Sudden death (GISSI-P *only*)
- ↓Atrial Fibrillation? (EPA+DHA might ↑)
- ↓Protection against ventricular arrhythmias (vs ↑)
- Heart rate variability improvement

Anti-atherogenic

- ↓Non-HDL-C
- ↓TG and ↓VLDL-C
- ↓VLDL and ↓Chylomicron remnants
- ↑HDL-C levels (vs ↓ w/ EPA-only)
- ↑LDL and HDL particle size
- Plaque stabilization

Antithrombotic

- ↓Platelet aggregation
- ↑Blood rheologic flow

Anti-inflammatory and endothelial protective effects

- ↓Endothelial adhesion molecules
- ↓Leukocyte adhesion receptor expression
- ↓Proinflammatory eicosanoids
- ↓Proinflammatory leukotrienes
- ↑NO production/vasodilation
- ↑Resolvins/protectins/maresins

↓Systolic and diastolic BP

AF=atrial fibrillation; CV=cardiovascular; FA=fatty acid(s).

JELIS: EPA Reduced Major Coronary Events* in Hypercholesterolemic Patients on Statins

N=18,645 Japanese pts with TC \geq 251 mg/dL prior to baseline statin Rx. Baseline TG=153 mg/dL. Statin up-titrated to 20 mg pravastatin or 10 mg simvastatin for LDL-C control.

*Primary endpoint: Sudden cardiac death, fatal and non-fatal MI, unstable angina pectoris, angioplasty, stenting, or coronary artery bypass graft. Yokoyama M et al. *Lancet*. 2007;369:1090-8.

JELIS: Larger Decrease in MACE in those with TG >150 mg/dL & HDL-C <40 mg/dL*

*Pre-specified. Saito Y et al. *Atherosclerosis*. 2008;200:135-40.

Randomized Controlled Trials and Prospective Cohort Studies of EPA+DHA or EPA-Only vs CHD Risk

Subjects with baseline TG levels >150 mg/dL

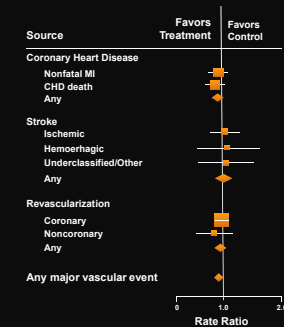

Alexander DD et al. *Mayo Clin Proc*. 2017;92:15-29. *EPA-only.

Lack of Apparent Effect of OM-3 on ASCVD May be Due to Low-Doses, Use of Dietary Supplements, or Lack of HTG Subjects

"... omega-3 fatty acids had no significant association with fatal or nonfatal coronary heart disease or any major vascular events."

| Study (Year) | EPA/DHA Dose (mg/d) | EPA / DHA Source |
|--------------------|---------------------|-----------------------------------|
| DOIT (2010) | 1150 / 800 | Dietary supplement |
| AREDS-2 (2014) | 650 / 350 | Dietary supplement |
| SU.FOL.OM3 (2010) | 400 / 200 | Dietary supplement |
| JELIS (2007) | 1800 / NA | Pure EPA Rx |
| Alpha Omega (2010) | 226 / 150 | Margarine with dietary supplement |
| OMEGA (2010) | 460 / 380 | Rx EPA/DHA |
| R&P (2013) | 500 / 500 | Rx EPA/DHA |
| GISSI-HF (2008) | 850 / 950 | Rx EPA/DHA |
| ORIGIN (2012) | 465 / 375 | Rx EPA/DHA |
| GISSI-P (1999) | 850 / 1700 | Rx EPA/DHA |

REDUCE-IT: Reduction of CV Events with Icosapent Ethyl – Intervention Trial

- Men and women ≥45 years of age
- Established CHD or at high risk for CHD (diabetes + ≥1 risk factor)
- Atherogenic dyslipidemia
 - All patients required to be on stable statin therapy for at least 4 weeks
 - LDL-C >40 mg/dL and ≤100 mg/dL prior to randomization into the study
 - TG ≥200 mg/dL

Bhatt DL, Steg PG, Brinton E, et al. *Clin Cardiol*. 2017; 40:138–48.

<http://www.clinicaltrials.gov/ct2/show/NCT01492361>

Primary Endpoint: CV Death, MI, Stroke, Coronary Revasc, Unstable Angina

Hazard Ratio, 0.75
(95% CI, 0.68–0.83)

RRR = 24.8%

ARR = 4.8%

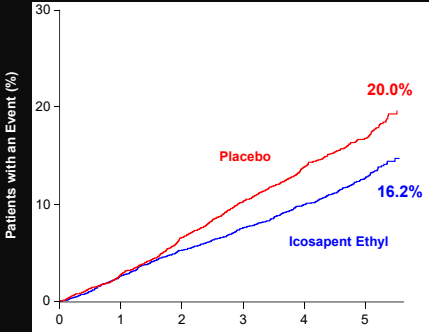

NNT = 21 (95% CI, 15–33)

Key Secondary Endpoint: CV Death, MI, Stroke

The graph displays the cumulative percentage of patients experiencing a cardiovascular event (CV death, MI, or stroke) over a 5-year period. The y-axis represents 'Patients with an Event (%)' from 0 to 30. The x-axis represents 'Years since Randomization' from 0 to 5. The Placebo group (red line) shows a higher cumulative event rate, reaching 20.0% at 5 years. The Icosapent Ethyl group (blue line) shows a lower cumulative event rate, reaching 16.2% at 5 years. The lines diverge significantly after the 2-year mark.

| Group | 5-year Event Rate (%) |
|-----------------|-----------------------|
| Placebo | 20.0% |
| Icosapent Ethyl | 16.2% |

Hazard Ratio, 0.74
(95% CI, 0.65–0.83)

RRR = 26.5%
ARR = 3.6%
NNT = 28 (95% CI, 20–47)
P=0.0000006

RRR denotes relative risk reduction

Icosapent Ethyl Better Placebo Better

Bhatt DL, AHA 2018, Chicago. Bhatt DL, Steg PG, Miller M, et al. N Engl J Med. 2018.

| | Icosapent Ethyl (N=4089) | Placebo (N=4090) | P-value |
|--|-------------------------------------|-----------------------------|----------------|
| Subjects with at Least One TEAE, n (%) | 3343 (81.8%) | 3326 (81.3%) | 0.63 |
| Serious TEAE | 1252 (30.6%) | 1254 (30.7%) | 0.98 |
| TEAE Leading to Withdrawal of Study Drug | 321 (7.9%) | 335 (8.2%) | 0.60 |
| Serious TEAE Leading to Withdrawal of Study Drug | 88 (2.2%) | 88 (2.2%) | 1.00 |
| Serious TEAE Leading to Death | 94 (2.3%) | 102 (2.5%) | 0.61 |

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med*. 2018.

Treatment-Emergent Adverse Event of Interest: Serious Bleeding

| | Icosapent Ethyl (N=4089) | Placebo (N=4090) | P-value |
|---------------------------------|-----------------------------|---------------------|---------|
| Bleeding related disorders | 111 (2.7%) | 85 (2.1%) | 0.06 |
| Gastrointestinal bleeding | 62 (1.5%) | 47 (1.1%) | 0.15 |
| Central nervous system bleeding | 14 (0.3%) | 10 (0.2%) | 0.42 |
| Other bleeding | 41 (1.0%) | 30 (0.7%) | 0.19 |

- No fatal bleeding events in either group
- Adjudicated hemorrhagic stroke - no significant difference between treatments (13 icosapent ethyl vs 10 placebo; P=0.55)

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med*. 2018.

Most Frequent Treatment-Emergent Adverse Events: ≥5% in Either Treatment Group and Significantly Different

| Preferred Term | Icosapent Ethyl (N=4089) | Placebo (N=4090) | P-value |
|---------------------|-----------------------------|---------------------|---------|
| Diarrhea | 367 (9.0%) | 453 (11.1%) | 0.002 |
| Peripheral edema | 267 (6.5%) | 203 (5.0%) | 0.002 |
| Constipation | 221 (5.4%) | 149 (3.6%) | <0.001 |
| Atrial fibrillation | 215 (5.3%) | 159 (3.9%) | 0.003 |
| Anemia | 191 (4.7%) | 236 (5.8%) | 0.03 |

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med*. 2018.

Conclusions

Compared with placebo, icosapent ethyl 4 g/day significantly reduced important CV events by **25%**, including:

- **20%** reduction in death due to cardiovascular causes
- **31%** reduction in heart attack
- **28%** reduction in stroke

Low rate of adverse effects, including:

- Small but significant increase in atrial fibrillation/flutter
- Non-statistically significant increase in serious bleeding

Consistent efficacy across multiple subgroups

- Including baseline triglycerides from 135-500 mg/dL
- Including secondary and primary prevention cohorts

Relative Risk Reductions (RRR) of Primary Endpoint in Recent CV Trials of Lipid or Inflammation Targeted Therapies

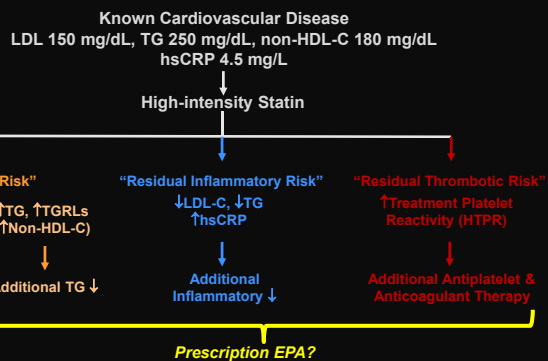

| Cardiovascular Outcomes Trial All patients on statin treatment | Active Treatment | Population | RRR (%) | NNT |
|--|--------------------------|---|----------|------------|
| Cholesterol absorption inhibitor IMPROVE-IT (2015) | Ezetimibe | 18,144 ACS patients | 6 | 50 |
| PCSK9 inhibitor FOURIER (2017) ODYSSEY OUTCOMES (2018) | Evolocumab Alirocumab | 27,564 pts with ASCVD+LDL-C>70 mg/dL 18,924 ACS patients | 15 15 | 67 62.5 |
| IL1-beta inhibitor CANTOS (2017) | Canakinumab | 10,061 stable ACS pts + hsCRP ≥2 mg/L | 15 | 56 |
| CETP inhibitor REVEAL (2017) | Anacetrapib | 30,449 pts w/ ASCVD on intensive atorvastatin RX | 9 | 100 |
| Omega-3 fatty acid REDUCE-IT (2018) | EPA, 4 g/d | 8179 Pts; 71% ASCVD, 29% high CVD risk + T2DM | 25 | 21 |

Note: these cross-trial comparisons are **very rough**, at best, due to differences in subject populations, primary outcome differences, and other trial design aspects.

Personalized Treatment Hypothesis in CAD

Non-Prescription Omega-3 Fatty Acids

Michael Miller, MD

Dietary Supplement Omega-3 FA Are Popular But Are Not FDA-Regulated (only Rx forms are regulated)

- Fish oil: Among the most commonly used dietary supplements by US adults¹
 - Global sales may reach \$3.3 billion by 2020
 - 19 million (8%) took fish oil dietary supplement in previous 30 days²
- There are no omega-3 OTC products in US (just prescription or dietary supplements)
- Dietary supplements are not FDA regulated. Content and efficacy often remain unverified.³

2. NIH NCCIH. Available at: <https://nccih.nih.gov/health/omega3/introduction.htm>
3. Mason RP. Biochem Biophys Res Commun. 2017;483:425-429.

Prescription vs Dietary Supplement Omega-3 FA

| | Prescriptions | | Dietary Supplements |
|-------------------------------------|---------------|-----------|---|
| | EPA | EPA +DHA | |
| FDA classification | Drug | Drug | Food |
| FDA approval | Yes | Yes | No |
| Ingredients | EPA | EPA + DHA | Variable EPA + DHA (vs few pure EPA) + other PUFAs and saturated FA |
| Omega-3 per capsule | 0.98 g | 0.84 g | Usually 0.2–0.4 g EPA; 0.1–0.3 g DHA |
| Capsules/day to provide 4 g omega-3 | 4 | ~4 | Usually 10–20 |
| Purity/efficacy & safety tested | Yes | Yes | Not required (usually not done) |

Recommended dose (AHA recommendation *before* Rx available)

- General: Eat oily fish or 1 g/day
- Prior CHD: 1–2 g/day (or >2 g/day directed by health care provider)
- For ↓TG: 2–4 g/day directed by health care provider

Fish-Oil Supplements Often Have Less Omega-3 Than Stated on the Label

Albert BB et al. Sci Rep. 2015;5:7928

Leading Dietary Supplement Fish Oils Have Highly Saturated and Oxidized Fatty-Acid Content

High saturated-fat content shown by solidity of FFA at room temperature

1. Mason RP. Biochem Biophys Res Commun. 2017;483:425-429.
2. Mason RP et al. Poster presented at the AMCP 2015 Nexus, Orlando, FL.

Summary of Fish-Oil Dietary Supplements: Right for CV Patients?

FDA Product Classification¹ → Food

Clinical Trials/FDA Pre-Approval¹ → Not Required

Content & Purity²⁻⁸

- Difficult to achieve AHA recommended OM-3 dosing
- May contain high saturated fat content
- Advertised omega-3 content may be overstated
- Often contain oxidized fatty acids which may increase CV risk
- Might contain PCBs and dioxins at harmful concentrations

Dietary Supplement Omega-3 not Recommended to Treat Serious Medical Conditions

APhA

"While omega-3 dietary supplements can be an important part of consumer wellness, unlike regulated prescription and OTC drugs, dietary supplements are not required to meet strict FDA drug standards for safety, efficacy, and manufacturing and are not intended to treat serious medical conditions like VHTG. Patients should consult with their doctor about appropriate FDA-approved drug therapy."¹

ADA Standards of Medical Care in Diabetes – 2017

"Randomized controlled trials also do not support recommending omega-3 supplements for primary or secondary prevention of CVD."²

1. Agarwal P. American Pharmacists Association Web site. <https://www.pharmacist.com/apha-convenes-stakeholders-appropriate-omega-3-fish-oil-use-vht>. Published April 21, 2015.
2. ADA Standards of Medical Care – 2017. *Diabetes Care*. 2017;40(Suppl 1):S1-S135.

Summary

• Guidelines and Recommendations

- Optimal TG level is <100 mg/dL
- Appropriate nutrition and physical activity in all
- Medical Rx for very high TG (>500 mg/dL) to help prevent pancreatitis
- Medical Rx for TG 200–500 mg/dL, consider in high-risk patient on statin (see below)

• Recommended Medical Rx

- Statins (for all high risk with TG 200–500 mg/dL, unless statin-intolerant)
- Fenofibrate*
- Omega-3[†] (no dietary supplements for therapy)
- Niacin difficult to use and no longer recommended

*HTG/low HDL-C subgroups had ↓CVD—T2DM cohort. †JELIS showed ↓CVD, HTG/low HDL-C subgroup especially positive.

Case Study and Q&A

Michael Miller, MD
James A. Underberg, MD, MS

Case: 69-yo Hispanic Woman on Medicare with Insulin Resistance, CHD, HTN, and Moderate HTG

S/P: MI 4 yrs prior, started on atorvastatin 40 mg/d. Repeat PCI 3 months ago, started on ezetimibe.

Meds: Enalapril 10 mg/d, HCTZ 25 mg/d, atorvastatin 40 mg/d, ASA 81 mg/d, clopidogrel 75 mg/d, ezetimibe 10 mg/d

Exam: BMI=29 kg/m², BP=149/86 mm Hg, Waist=41", non-smoker

Labs:

| | | | |
|---------|-----------|-----------|-----------|
| A1c | 6.4% | LDL-C | 65 mg/dL |
| Glucose | 123 mg/dL | HDL-C | 50 mg/dL |
| TC | 168 mg/dL | Non-HDL-C | 118 mg/dL |
| TG | 265 mg/dL | | |

ASA=aspirin, MI=myocardial infarction; PCI=percutaneous coronary intervention.
